TREND DEFINITION

Trends are a part of the cycle of innovation and have always influenced how we interact with each other. The term “trend” can be used in so many contexts like economics, social media, fashion, etc. Trends spread when people like, copy and adapt the latest popular thing that is prevalent in the market. Henrik Vejlgaard in his book, *Anatomy of a Trend* says, “*That it is a social process means it’s created by human beings.*” (Vejlgaard, 2008)

Fig. 5

These cycles of innovation over the years in tech have given birth to Artificial Intelligence (AI) which has taken various industries by storm. According to Coursera, AI refers to computer systems capable of performing complex tasks that historically only a human could do, such as reasoning, making decisions, or solving problems (Coursera, 2024). The AI trend is shifting from adoption to integration across industries.

Fashion is an industry where AI significantly impacted, especially, in unexpected ways. It is the new micro trend: Generative or GenAI, transforming fashion from supply chain management to production processes to fashion campaigns. If we look at the micro level, it all starts with trends manifesting into fashion campaigns where brands use GenAI for campaign imagery to make it the talk of the town.

“In their simplest sense, trends are the direction (or vector) along which particular forces (or agents of change) travel. These forces can be products, processes, even people.” (Raymond. 2010)

Agreeing with him, Vejlgaard considers a trend to be “*a social process in which style or taste changes*” (Vejlgaard, 2008).

Fig. 6

“THE ONLY
CONSTANT IN
LIFE IS
CHANGE.”
- HERACLITUS

A Macro Trend is a clustering of influences which can include a number of Mega Trends (major cultural shifts) and calculable events, and a Micro Trend is a niche or industry specific consumer behavioural trend which is mass market ready and actionable. (TrendBible, n.d.)

*Macro Trend: AI
Micro Trend: GenAI
for fashion marketing
campaign imagery*

MACRO & MICRO INFLUENCES

The current macro trend: AI, prevalent since 2020, is transformative across industries revolutionising them through automation and personalisation. GenAI is one such micro trend of AI which is rapidly being adopted across industries. For fashion, GenAI can be used for various applications but here we are focusing it as a micro trend in Gen AI for fashion marketing campaign imagery.

"Generative Artificial Intelligence (AI) describes algorithms (such as ChatGPT) that can be used to create new content, including audio, code, images, text, simulations, and videos." (McKinsey & Company, 2024)

Fig. 8

Fig. 9

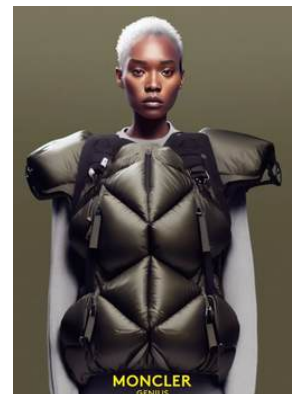

Fig. 10

The adoption by some fashion brands of GenAI for campaign imagery is because of how commercially lucrative it is to them as it cuts costs and time. For this reason, it also helps brands to do trend analysis and make collections. Some of the examples are: Shein, an online fashion retailer, is famous for using AI for analysis of fashion trends and profits; Maison Meta, an AI agency, helped American designer Norma Kamali to bring her vision of her swimwear range into reality through AI; The same agency collaborated with brands like Moncler, Revolve, etc to create the imagery of their campaigns using GenAI.

PESTLE ANALYSIS

Focused Research: **Economical**

By 2027, the utilization of AI in the global fashion business will rise to £4.4 billion (Premiere Vision, 2024). Luxury houses and e-commerce brands have started using GenAI tools to generate marketing content, customer segmentation and customer-seller dialogue personalisation (Journal Du Luxe, 2024).

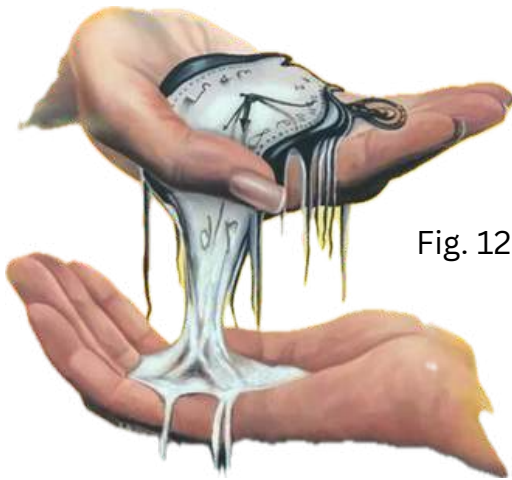

Fig. 12

Fig. 11

GenAI has the capability of analysing datasets helping in predicting consumer behaviour, enabling targeted marketing campaigns that boost sales and identify any economic downturns. (PESTLEanalysis, 2020) It also offers economical and scalable solutions through automated tasks like image generation, reducing the need for expensive photoshoots. (PrimeAI, 2024) This way brands can enhance their visual marketing strategies aligning with the brand aesthetic.

But all this also suggests it could limit the number of jobs in marketing and production.

Fig. 13

Fig. 14

PESTLE ANALYSIS

Focused Research: **Technological**

The tech-celeration of AI has led its market for products and services to reach between £780 billion and £990 billion by 2027 (Crawford, Wang and Singh, 2024). AI in the fashion industry can be used right from supply chain management to production processes to marketing. Nike, H&M, Mango etc. have already started leveraging the use of AI.

GenAI can automate campaign visuals reducing production time and costs resulting in faster executions. Implementing GenAI involves risks such as system errors, data breaches, and biases requiring careful planning and risk prevention. (PESTLEanalysis 2020) Continuous innovations in GenAI would require fashion brands to keep a pace with it in order to stay updated and relevant in the market.

Fig. 15

Fig. 16

Fig. 17

PESTLE ANALYSIS

Fig. 18

Focused Research: **Legal**

Legal firms are looking for ways for the integration of technology into their tasks like identifying terms in large datasets, analysing vast volumes of documents, and accurately filling out forms when properly implemented (PESTLEanalysis 2020). With the amalgamation of AI and Fashion, there are certain legal complexities too.

Gen AI raises legal questions about ownership and intellectual property rights for AI generated images where there are risks of replicating designs or mimicking proprietary brand elements. (TaylorWessing, 2024) With the use of AI, brands would be required to be transparent with the adoption and use of such technology to maintain consumer trust.

The fashion industry faces legal challenges as AI becomes a key component for businesses within the industry including compliance with evolving regulations like the EU AI Act. (TaylorWessing, 2024)

Fig. 19

Fig. 20

TIMELINE

AI has seen growth since the 1950s, and post 2020, AI has seen a surge because of GenAI. GenAI has become a powerful tool for the fashion industry as it helps boost its operations and consumer engagement. This timeline traces the evolution of GenAI in fashion campaigns, with a particular emphasis on the rise of GenAI for creating imagery.

Technology and AI are making a difference in the fashion industry. Using AI for marketing campaigns can help brands to gain consumer engagement and profits without compromising on the brand's aesthetic.

Fig. 21

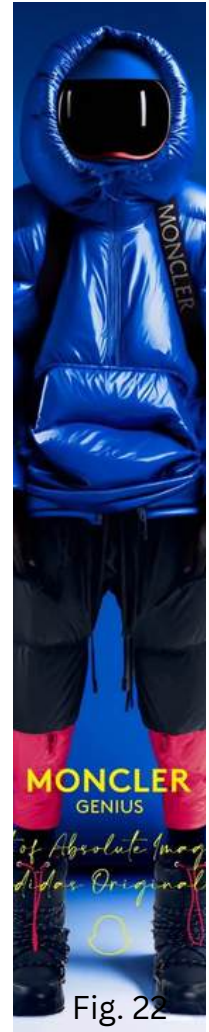

Fig. 22

Fig. 23

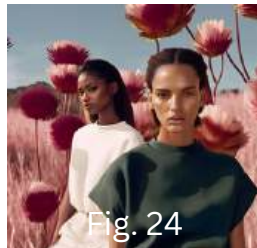

Fig. 24

Fig. 25

“73 % of fashion executives said generative AI will be a priority for their businesses in 2024, but just 28 percent have tried using it in creative processes for design and product development.”

-- BoF Team, McKinsey & Company 2023

Fig. 26

Fig. 27

Fig. 28

STEPPING STONE (2015-2017)

Fig. 29

Nike used AI for creating personalised shopping experiences through its "Nike Fit" app offering accurate shoe sizing. Since then, Nike has also leveraged GenAI for its supply chain management by studying its consumer's behaviour for a more personalised experience, and product designing for its newer models of shoes. (IndustryWired, 2020)

Fig. 30

Zara began using AI to forecast trends and manage inventory through analysing social media and sales causing them to adapt to changing trends and optimise stock. (IndustryWired, 2020)

EXPANDING AI (2018-2020)

Fig. 31

H&M started using AI for a personalised shopping experience through its app, recommending products based on past purchases and browsing history giving a personalised experience. (IndustryWired, 2020)

Fig. 32

Dior launched "Dior Insider," an AI beauty assistant on Facebook Messenger, offering personalised product recommendations in cosmetics. (IndustryWired, 2020)

Fig. 33

Tommy Hilfiger collaborated with IBM and FIT for its "Reimagine Retail" project where it explored AI for trend prediction and design enhancement. (IndustryWired, 2020)

Fig. 34

E-commerce giant Alibaba integrated AI into its FashionAI store to detect consumer preferences and sell trendy products. (IndustryWired, 2020)

RAPID EXPANSION (2021-2023)

Fig. 35

Fig. 36

Fig. 37

More companies like Amazon, Asos, Burberry, Shein, Stitch Fix and Farfetch joined hands with GenAI either for trend analysis or personalised recommendations to its customers. Existing brands in the AI trend adopted more AI features like Google's GenAI model for virtual try on. (Google, 2023)

Fig. 38

MAISONMETA

Maison Meta, an AI innovation agency, conducted an AI Fashion Week which had its season one and two in 2023 and 2024 respectively. With thousands of submissions from all over the world showcasing their creativity by amalgamating AI and fashion presented breathtaking looks.

Fig. 39

Valentino started the year with using AI for marketing campaign which was a part of his Fall2023 collection. The images portrayed a hybrid world between human and machine executed by AI specialist Vittorio Maria del Masso. (Jing Daily, 2023) Followed by Moncler, Pandora, Revolve, Pangaia and Casablanca; 2023 saw a range of GenAI marketing campaigns in collaboration with Maison Meta. The main reason for the brands were to make full use of the technology at hand to bring their campaign vision to life in AI and for some cases like Pandora, try on different techniques like 3D design with AI.

ADVANCED APPLICATION (2024 ONWARDS)

Fig. 40

MANGO Fig. 41

Continuing the creativity of GenAI generated marketing imagery Mango and Dolce & Gabbana Casa followed the trend.

Fig. 42

Technology and AI are making a difference in the fashion industry. Using AI for marketing campaigns can help brands to gain consumer engagement and profits without compromising on the brand's aesthetic.

INNOVATORS

& INFLUENCERS

Fig. 43

Fig. 44

Fig. 45

At the forefront is Maison Meta, worldwide first Generative AI innovation agency. They believe that through AI exploration has the power to push the boundaries in the digital space.

They provide custom AI solutions in the fields of FASHION / BEAUTY / INTERIORS / DESIGN & ART. They are a proud founding partner of the first AI Fashion Week, a global contest that invites everyone to display their creations made by leveraging AI. The winners of the Fashion Week get a chance to make their AI collections come real by collaborating with Revolve.

They aim to provide an expertise and vision to brands in order to make them stand out and gain customer engagement. They deal with brands like Pandora, Dolce & Gabbana Casa, Revolve, Moncler, etc

At AI Fashion Week,
Human Creativity
Remains the Focus

Fig. 46

Fig. 47

Fig. 48

Freelancer, Vittorio Maria del Masso is a Brand Strategist and Art Director. He's into AI Augmentations since 2017. He seeks inspirations, wisdom answers from his surroundings and seeks to use them in his innovations. He has a strong portfolio with clients like Armani, Valentino, etc.

A British image maker, Luke Nugent helped Casablanca with their AI marketing campaign imagery. He works in fields of fashion; music and portraiture. He uses the combination of both traditional and emerging image making technologies. Being an early adopter of Artificial Intelligence for image-making, Luke has created AI campaigns for brands including CASABLANCA, Levis, etc

Fig. 49

Fig. 50

Fig. 51

TREND THEORY

Diffusion of Innovation Theory

E.M. Rogers in 1962 developed the Diffusion of Innovations Theory (Boston University, 2022). It can be applied to understand the adoption of GenAI for marketing campaign imagery in the fashion industry. This theory states that the adoption of GenAI for our micro trend follows a predictable pattern through five categories of adopters:

Innovators

These are risk-taking and progressive individuals or organisations that are the first to adopt new technologies. In the fashion industry, these might be brands or designers known for pushing boundaries in creativity by experimenting with GenAI for marketing campaigns, like Maison Meta, Valentino, Casablanca, etc.

Early Adopters

These individuals or organisations are opinion leaders and trendsetters who are open to new ideas and influence others. Fashion brands in this category would be eager to adopt GenAI for a competitive advantage when they start recognising its potential for creating unique and engaging marketing content. For example, after the successful GenAI fashion marketing campaigns in 2023, Mango and Dolce & Gabbana came out with theirs in 2024

Early Majority

This large group observes the success of the innovators and early adopters before adopting an innovation themselves. In this case, fashion brands would adopt GenAI once its effectiveness and cost-efficiency are proven through successful campaigns.

Late Majority

This group plays safe and adopts innovations only

after they become mainstream. Some fashion brands might adopt GenAI out of necessity when it becomes the industry standard for creating marketing imagery.

Laggards

These are the last to adopt an innovation and are resistant to change. In this scenario, fashion brands may only adopt GenAI when it becomes unavoidable or necessary to remain competitive.

GenAI for marketing campaign imagery appears to be in the early adoption phase where innovators and early adopters are leading the way. Through this theory we can predict that if the cost of implementing GenAI decreases and the technology becomes more accessible, the rate of adoption may increase. Conversely, if consumers perceive GenAI-generated imagery as inauthentic or brands fail to address ethical concerns, adoption might be slower. Also, if we analyse the diffusion of GenAI in other areas of fashion, for example, the adoption of GenAI chatbots in customer service, it can offer insights for fashion brands for using GenAI for marketing.

Fig. 52

Fig. 53: Diffusion of Innovation Theory Curve

CHALLENGES . . .

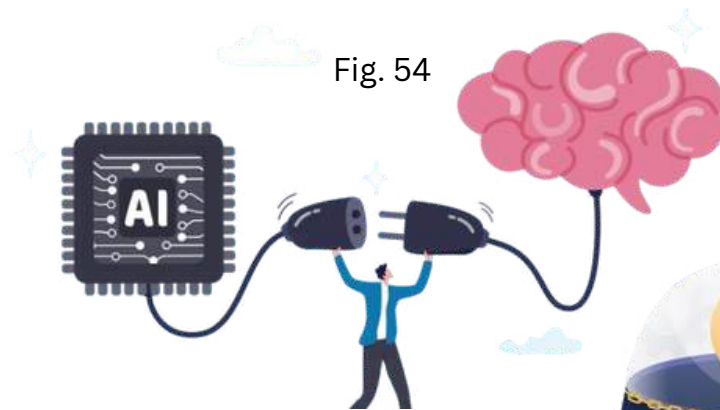

Fig. 54

HOW TO SPOT A FAKE?

Fig. 55

Fig. 56

Authenticity

Human beings as a customer might have a tough time considering an AI generated campaign authentic and building an emotional connection with it, unlike with marketing campaigns involving real humans. (Akbari et al. 2024) They would take time to build trust. Also, fashion brands have to mention if they have used AI for their campaigns as it would make the audience feels they have been transparent with them.

Biases and Ethics

AI models are trained using various datasets which can result in inaccurate data showing a lack of diversity in the AI generated images for fashion marketing campaigns and using it ethically without any copyright infringements

Balance

While AI enhances marketing campaigns with its imagery, it cannot replace human creativity.

Having a balance between AI tools and human creativity is still important.

When Casablanca's AI marketing campaign received backlash over fear of loss of jobs in creative fields, its creative director emphasised that AI is an additional tool, not a replacement highlighting the creative input involved for the campaign from different people like, stylists, set designers, etc (BOF Fashion, 2023).

High Implementation Costs

The cost of adopting AI including the cost of hardware, software, and specialised talent can be exorbitant, especially for smaller fashion brands and startups.

Technological Barriers

Many fashion brands lack necessary expertise and infrastructure effective execution of AI which required continuous investment in skill development, technology advancement, and adaptation.

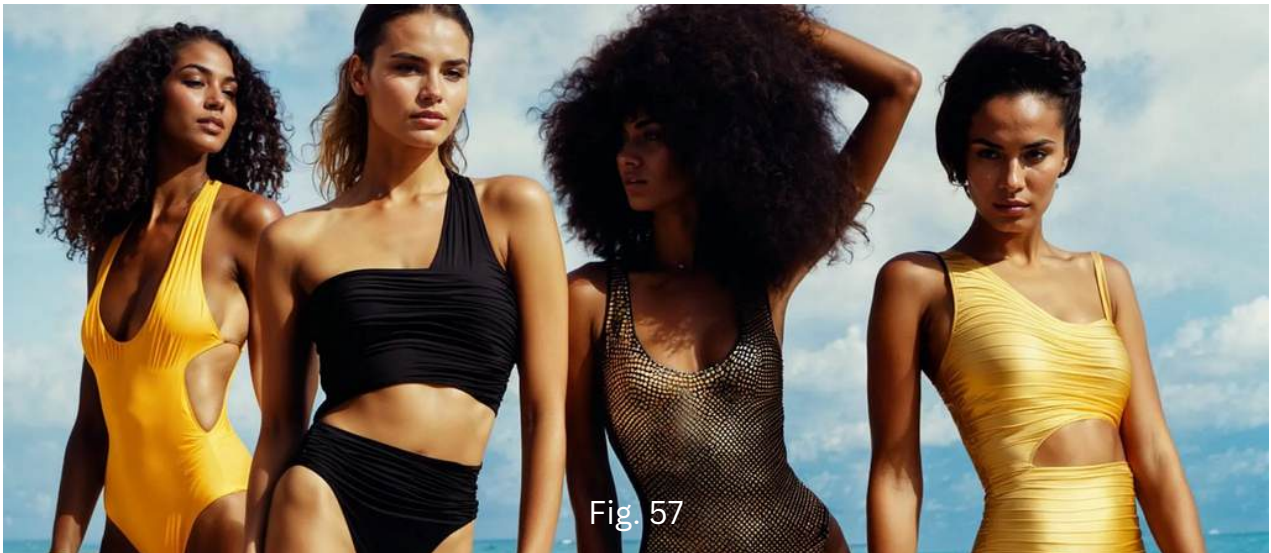

Fig. 57

& OPPORTUNITIES

Fig. 58

Hyper personalised campaigns

GenAI has the capability of generating hyper personalised imagery for marketing campaigns based on the data regarding tastes and preferences and past behaviours of a brand's consumers, which would be gathered accurately using AI as most current brands are doing so

Data driven campaigns

Fashion brands are using AI to get accurate consumer data, and the number of other brands adopting the same method is growing, it is evident that this would help brands to test the effectiveness of their AI marketing campaigns. This would also help brands to adopt changes in their strategies if needed.

Enhance Creativity

Human creativity is irreplicable, but it can be

combined with AI tools to create a more enhanced version of art with AI tools to create a more enhanced version of art and that's what brands did with their AI generated marketing campaign imageries pushing creative boundaries to stand out.

Rapid content creation

Since AI can generate images which are high in quality and in less time, this would reduce the time taken in traditional photoshoots for the campaigns. Due to this brands can jump on any trend fast and be updated always

Sustainability

Apart from trends analysing and forecasting causing minimal material waste, GenAI can also help brands reduce the carbon footprint produced by traveling for campaign photoshoots. (Neural Fashion, 2024)

KEY INSIGHT

Fig. 77

HYPER- PERSONALISED GEN-AI FASHION MARKETING CAMPAIGNS

Fig. 76

These days content creation is done with a main focus on Hyper-personalisation. Entertainment apps have given this experience to their consumers and now the consumers have such expectations from other brands too.

"Advanced personalisation techniques are setting a high bar for fashion brands – 71 percent of consumers expect personalised interactions with companies." (BOF, 2022)

Gone are the days when "personalised experience" for the consumers meant bespoke. To achieve providing this experience to their customers, brands need to connect with them online which is affected by high competition for attention on social media, loss of brand loyalty and modified access to third-party data for consumer data like their browsing habits. The only solution for this is personalisation. (BOF, 2022)

That being said, brands can use GenAI for trend analysis and to have the accurate data of their customer's browsing habits, tastes and preferences to provide them with hyper-personalised experiences.

A key insight from the micro-trend of GenAI for marketing campaign imagery is its capability to provide hyper-personalized marketing campaigns in the fashion industry over the next 1-2 years. This means that fashion brands will use GenAI to create unique and creative images tailored to each individual customer's preferences, adopting a radical approach instead of the one-size-fits-all one. Analysis of data would help fashion brands to forecast trends that can be creatively put into campaigns where the imagery is created by GenAI. It would resonate with an individual consumer creating an engaging and hyper-personalised experience.

Benefits

Enhanced Customer Experience: Imageries in AI generated marketing campaigns reflecting a customer's individual style and preferences, it would evoke a sense of emotional connection and authenticity between brands and customers. Due to this they are more likely to engage with the brand and make a purchase.

Cost Savings and Efficiency: GenAI can help with the creation of marketing campaign imagery, reducing the reliance on expensive photoshoots. This brings a change in content creation and can potentially lead to significant cost savings for fashion brands.

Diversity and Inclusion: GenAI can generate images that represent a diverse range of body types, ethnicities, and styles which would allow fashion brands to create more inclusive marketing campaigns that resonate with a wider audience and reflect the diversity of their customers.

By embracing GenAI fashion brands need to consider using it ethically and being authentic to their audience about using it. Providing a hyper-personalised experience through amalgamation of GenAI with marketing campaign imageries would help brands build an individual bond with their customers by understanding their needs and in some cases, also helping them to navigate their tastes and preferences.
